

CITY OF ROGUE RIVER PUBLIC WORKS DEPARTMENT

2018 Consumer Confidence Report

Dear Water Customers.

We are pleased to present to you our 2018 Annual Consumer Confidence Report. This report is designed to inform you about the quality of water and services we deliver to you every day. Our continuous goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect water resources. We are committed to ensuring the quality of your drinking water. This report presents water quality data and explains their facts on public health.

Source of Water

Our water sources are surface water drawn from the Rogue River and wells. During the drought of the 1980's and early 1990's the City of Rogue River realized that it could no longer supply an adequate amount of water from its wells. In 1994 the City built the water treatment plant which now has been in successful operation 25-years. Depending the time of year and customer demand, thewatertreatment plant presently produces between 10thousand to 960-thousand gallons of water per day, and the wells produce up to an additional 692-thousand gallons a day. At the present time, the City will typically run the water treatment plant during the summer months when the demand for water is high. During the winter, when water demand is low and the river is more difficult to treat the City uses five local wells for its water supply.

Depot Street Bridge at John F. Flemming Memorial Park

Water Treatment

Surface water from the Rogue River is pumped through and intake structure and into the treatment plant where both chemical and physical takes place. The finished water is chlorinated for disinfection and then pumped into the drinking water system.

The drinking water plant is now 25 years old and has functioned amazingly well for those years. The well system is much older, with age though also come increased challenges as many critical components of the plant and well system were close to or had exceeded their useful service lives. This with an ever increasing demand, also greater water quality expectation in performance monitoring and standards by the Oregon Health Authority it was time to make improvements to the treatment facilities. With these items pending the City has completed a significant upgrading of the Treatment facilities in the last year. The Facilities both Wells and Treatment Plant have seen many significant improvements to automated valves systems, treatment processes, computer controls, electrical and metering. With ever increasing testing and

process control monitoring requirements the need for a high level of advanced staff training has occurred throughout the upgrading process and continues today.

Currently our lead Operator for the City's Drinking Water System is Josh Froloff (pictured on your right) who also assisted in most of the improvements. Our Assistant operator Jeb Poling (pictured on your left) and technical support specialist Ms. Debbie Bunker... along with rest of the exceptional Public Works staff have made excellent drinking water.

We are pleased to announce that our drinking water is safe and exceeds Federal and State Requirements!

Monitoring and Reporting Requirements

The Public Works Department routinely monitors for contaminants in your drinking water according to Federal and State laws. The data within this report comes from the monitoring of our drinking water supply for the period of January 1 to December 31, 2018.

All drinking water, including bottled drinking water, may reasonably be expected to contain at least small amounts of some contaminants. It is important to remember that the presence of these contaminants does not necessarily indicate that water poses a health risk.

Federal and State regulations include procedures and schedules for monitoring water from the source to the tap. The State Drinking Water Program ensures that public water systems comply with all regulations, follow monitoring schedules, and report monitoring results. The City monitors the physical, chemical, and microbiological characteristics of your drinking water and is in compliance with these regulations.

Storage and Distribution

Treated water is pumped from the plant and wells to two reservoirs with a combined storage capacity of 1.7 million gallons. From the reservoirs the water is gravity fed in to the distribution system. The distribution system is made up of 2" to 10" pipes with an approximate total length of 13-miles.

Once the water is in the reservoirs, it then gravity flows to homes and businesses in town as it is needed. Inorder to meet the continuing demand for water, the City is constantly upgrading its system. The City has a 20-year Water Master Plan which details future water system improvements. These improvements will occur over the coming years.

2018 Water Production in gallons:

January	10,028,000
February	8,784,000
March	9,435,000
April	9,751,000
May	14,243,010
June	19,348,000
July	22,511,000
August	19,103,000
September	14,675,000
October	13,665,000
November	8,396,000
December	9,867,000
•	

Acronyms and Key Definitions

Maximum Contaminant Levels (MCLs) are set at very stringent amounts. To understand the possible health effects described for many regulated contaminants, a person would have to drink 2-liters of water every day at the MCL for a lifetime to have a one-in-a-million chance of contracting the described health effect.

Maximum Contaminant Level Goal (MCLG) The level of a contaminant in drinking water for which there is no known or expected risk to health.

Action levels (AL) The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

NTU: NephelometricTurbidity Unit. Unit of measure used to describe water clarity. The smaller the number, the clearer the water.	ppm: parts per million. This is the same as mg/I. An example of 1 part per million is one drop of water in 22 gallons.
Contaminant: Any substance found in water; however, not all contaminants are harmful.	ppb: parts per billion. One ppb is approximately equal to 1-drop of water in a swimming pool that is 30" in diameter and 4' deep (21,195 gal. of water).
@: at the detection limit. ND@ 0.0 ppm or parts per million.	ND@: Not detected at a given range because laboratory instruments can only detect to certain minimum levels.
NR: Not required this year	ND: No data collected.
MFL: Million Fibers per Liter	UR: Unregulated Contaminant. A substance in drinking water that is not regulated by EPA but is monitored for other purposes.

More information about contaminants and potential health effects can be obtained by calling the following numbers:

EPA, Safe Drinking Water Hotline: 800-426-4791

Oregon Health Authority, DWP: 971-673-0405

Jackson County Environmental Health Department: 541-774-8206

The following tables show that our system had no contaminant violations. We are proud that your drinking water meets or exceeds all Federal and State requirements.

Results of Turbidity, Microbiological Analysis & Disinfection By-Product Residuals of Treated Water After Disinfection

Results meet or surpass State and Federal drinking water regulations

Variable	Maximum Amount Tested	Maximum Contaminant Level (MCL) Maximum	Contaminant Level Goal (MCLG)	Source of Contaminant
Physical Characteristic Testing	Maximum 0.27 NTU			
Turbidity (Surface Water)	Minimum: 0.04 NTU	0.30NTU	<0.1 NTU	Soil erosion and stream sediment
Microbiological Testing Total Coliform Bacteria	Zero positive tests	Zero positive tests	Zeropositive tests	Naturally present in the environment
E. Coli	Zero positive tests	Zero positive tests	Zero positive tests	Human and animal feces
Disinfection Residual	All samples had detectable chlorine residual	4.0 mg/l	NA	Chlorine is used as a disinfectant in the water treatment process
Total Trihalomethanes (TTHM)	0.031 ppm	0.080 ppm	NA	Drinking water chlorination by-products
Halo Acetic Acid (five) (HAA5) *	0.021 ppm	0.060 ppm	NA	Drinking water chlorination by-products

Turbidity and NTUs

Turbidity is regulated because it can provide a medium for bacterial growth. Turbidity or (cloudiness) of water is measured in NTUs. The filtration plant consistently treats water that surpasses Federal and State standards. Well water is not required to be measured for turbidity.

Total Coliform Bacteria

Testing for these bacteria after disinfection helps to confirm the effectiveness of the disinfection process. (Bacteria may have been present in the source water.) Total coliform bacteria are also indicators of possible contamination that might occur after treatment.

Chlorine Residual

Federal and State drinking water regulations require detectable disinfectant (chlorine) residual throughout our distribution system. Water entering the City's distribution system from the Water Treatment Plant has an average chlorine residual of 0.50 to 1.40 parts per million.

"Some people may be more vulnerable to contaminants in drinking water than the general population. Immune compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791)."

RESULTS OF LEAD AND COPPER SAMPLING

at Residential Water Taps*

Results meet or surpass current State and Federal drinking water regulations

Variable	Amount Detected	Maximum Contamination Level (MCL) Maximum	Contaminant Level Goal(MCLG)	Source of Containment	
Copper	90-percent of the homes tested had copper levels less than 0.137 ppm	Action Level: 90% of the homes tested must have levels less than 1.3 parts per million	<1.3 parts per million	Corrosion of Household	
Lead	90-percent of the homes tested hadlead levels less than 0.0061 parts per million	Action Level: 90% of the homes tested must have lead levels less than 0.015 parts per million	0 parts per million	plumbing	

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Rogue River is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 1 to 2-minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods and safe steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4791) or at

*Note: Lead & Copper were tested for in 2016 (the next round of sampling will be in 2019)

RESULTS OF NUTRIENT ANALYSIS:

Samples are collected at the Water Treatment Plant and Wells Results meet or exceeded State and Federal drinking water regulations.

Variable	Maximum Amount Tested	Maximum Contaminant Level (MCL) Maximum	Contaminant Lever Goal (MCLG)	Source of Contaminant	
Nutrients Nitrate Nitrogen	0.25 ppm at Water Treatment Plant	10 parts per million	10 parts per million	Runoff from fertilizer use: Leaching from septic tanks, sewage; erosion of natural deposits.	
Nitrate Nitrogen	1.10 ppm at Wells	10 parts per million	10 parts per million		

Note: Nutrients can support microbial growth such as bacteria and algae. Nitrate and nitrite levels in excess of the standards can contribute to methemglobinemia (blue baby syndrome) in infants less than six months old. In adults, excessive levels can contribute to kidney or spleen problems.

We at the Rogue River Public Works Department strive to provide top quality water to every tap. We ask that all our customers help us protect our water source, which is the heart of our community, our way of life and our children's future. If you have any questions about this report or your water source, please contact City Public Works Director, Michael Bollweg at 541-582-4401 ext. 103, stop by City Hall at 133 Broadway, mail correspondence to Box 1137, Rogue River, Oregon 97537 or visit our website at www.cityofrogueriver.org. We want all of our customers to be informed about their water quality.
